

"Driven to Excellence"

Wetland Restoration and Management

Wetlands provide habitat for countless aquatic and terrestrial plants and animals. Wetlands also provide ecological services like flood protection, water quality improvements, shoreline erosion control, recreation, and aesthetics. These numerous and important ecological services are why it is so important to protect and restore native wetlands.

At Rock Leaf we understand the importance and uniqueness of each wetland. We are here to provide services to both protect and restore wetlands for project managers and landowners alike. Our knowledgeable staff have multiple years of experience working in and around wetlands and several staff are certified Minnesota Wetland Professional's In-Training. We can provide wetland delineations, site assessments and management plans, invasive species and non-wetland species control, and establish native vegetation.

Questions? Feel free to contact us:
